FARRIS

What is a Transaction?

A **TRANSACTION** is a

- business event
- whose relevant attributes need to be recorded
- either internally (in the corporate database),
- or externally (as a document produced for a customer or supplier),
- or both,
- due to the impact this information will have on other operations or decisions.

A movie theater sells tickets.
What data should be captured, and why?

Clarifications

1. Types of relevance:

➤ Operational:

relevant to doing the work → Transaction Data

➤ Managerial:

relevant to monitoring how well the work is done → Control Data

2. Occurrences that do not happen, but are *expected* to happen, also constitute transactions.

3. Queries are ordinarily not transactions, unless tracked.

What happened vs. what was recorded

The event: Returning a rental item (such as a videotape) on time.

	It was recorded	It was not recorded
It really happened	<p>Example: A rental item is returned on time and is recorded as having been returned on time</p> <p>↓</p> <p>OK</p>	<p>Example: A rental item is returned on time but is mistakenly stamped as having been returned late.</p> <p>↓</p> <p>Loss of Customer Good Will</p>
It really did not happen	<p>Example: A rental item is returned late and it is stamped as having been returned late.</p> <p>↓</p> <p>OK</p>	<p>Example: A rental item is returned late but is not recorded as such (is recorded as having been returned on time.</p> <p>↓</p> <p>Loss of Revenue</p>

The Vulnerable TPS

1. The customer picks up an item from the store, goes to the Returns Department, says he wants to “return” this item but has lost the receipt, gets a “refund” and leaves.
2. The customer buys an item. A few days later, he takes it to the Returns Department, shows his receipt as proof of purchase, returns the item, and gets a refund. A few days later, he takes his receipt, picks up a similar item from inside the store, takes it to the Returns Department again, shows his receipt as proof of purchase, “returns” the item, and gets a refund for the second time.
3. The customer buys an item, shows his receipt at the exit as proof of purchase, and takes it to his car. An hour later, his friend takes the receipt, enters the same store, picks up a similar item, shows his receipt at the exit as proof of purchase, and takes it out.
4. The customer buys an item that costs \$7 and tenders a \$10 bill. When he receives \$3 in change, he claims that he had really tendered a \$20 bill and therefore should be paid \$13 in change.

Costco Wholesale **657** Store Number
 7100 N. Abby
 North Fresno, CA

Store Address {

Invoice # **0040504** Unique Transaction Number

Why Capture? {
 Date 12/20/82
 Time 12:06PM
 Auth # 00000000

Debit Acct # Account Number
 XXXXXXXXXXXXX9200

Pump	Gallons	Price
09	14.428	\$1.319

Product	Amount
Unleaded	\$19.03 = Gallons * Price

Total Sale \$19.03

SALE - Card Swiped
 APPROVED

We appreciate your
 Costco Membership.

Sale = Sale-Number, Store-Number, Account-Number, Date, Time, Gallons, Price, Amount (?), Pump (?), Payment-Type (?)

The Transaction Ripple Effect

- Transaction data are stored locally in a file bearing the name of the transaction type.
- Typical transaction file contents:
 - Identification data
 - Transaction data (what, who, how much, etc.) – collected to run operations
 - Control data (why, where, when etc.) – collected to run operations well
- Transaction data travel to other parts of the organization to inform those impacted by it.
- Transactions in one part of the organization trigger events in other parts

Transaction: Ship customer order

Ripple Effects:

- Reduce inventory quantity-on-hand
- Update customer balance-due
- Reduce customer credit-available

A customer returns a defective product

Identification data:

Transaction data:

Control data:

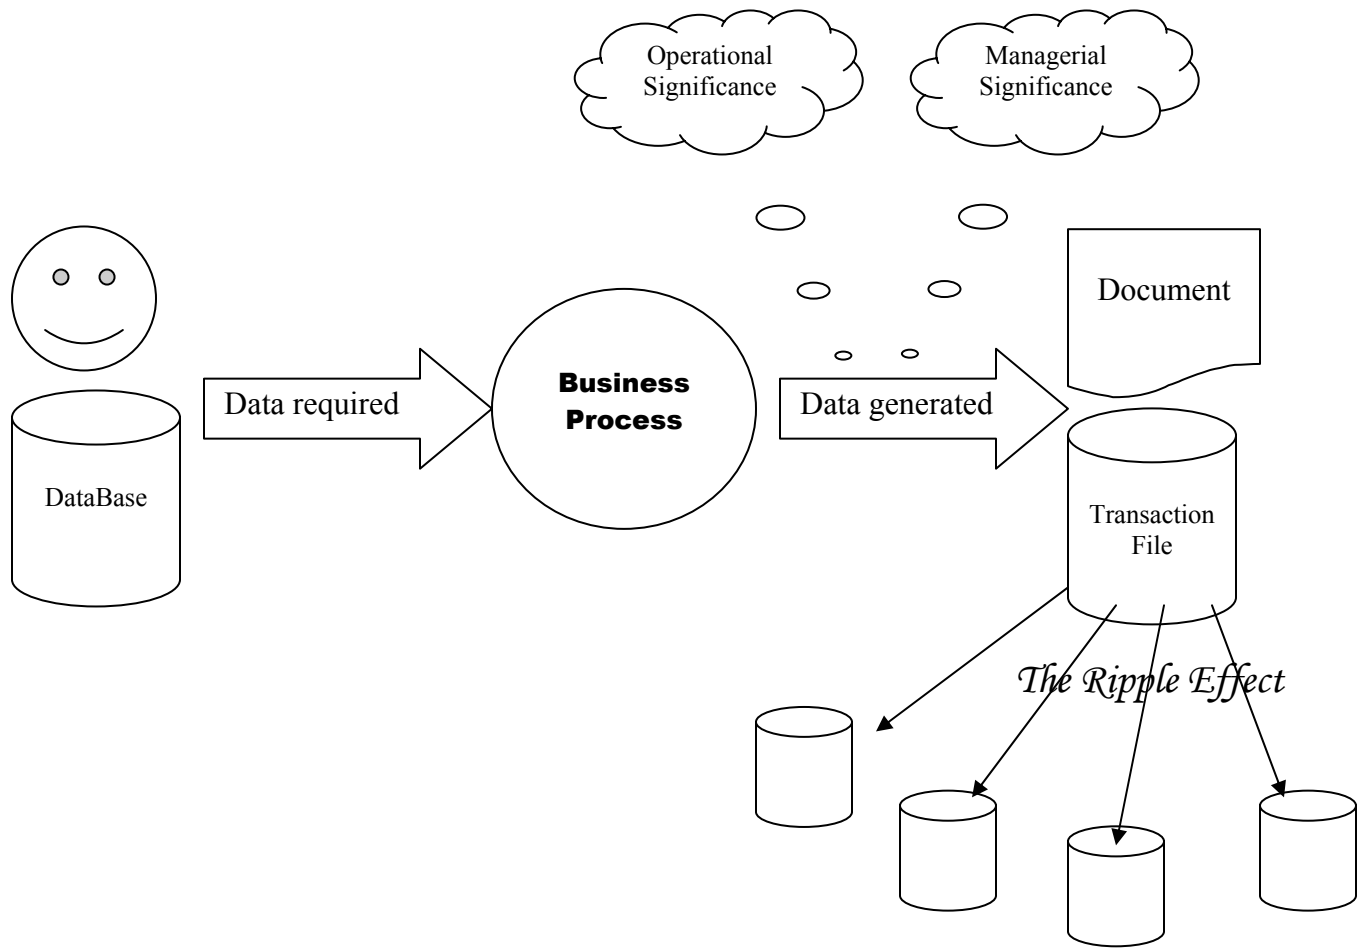

A sales rep takes a prospective customer to lunch

Identification data:

Transaction data:

Control data:

TPS : The Big Picture

Characteristics of TPS

- Large amounts of data
- Generated and processed on a regular, continuous basis
- In multiple locations
- The computations are not mathematically complex
- High reliability is required

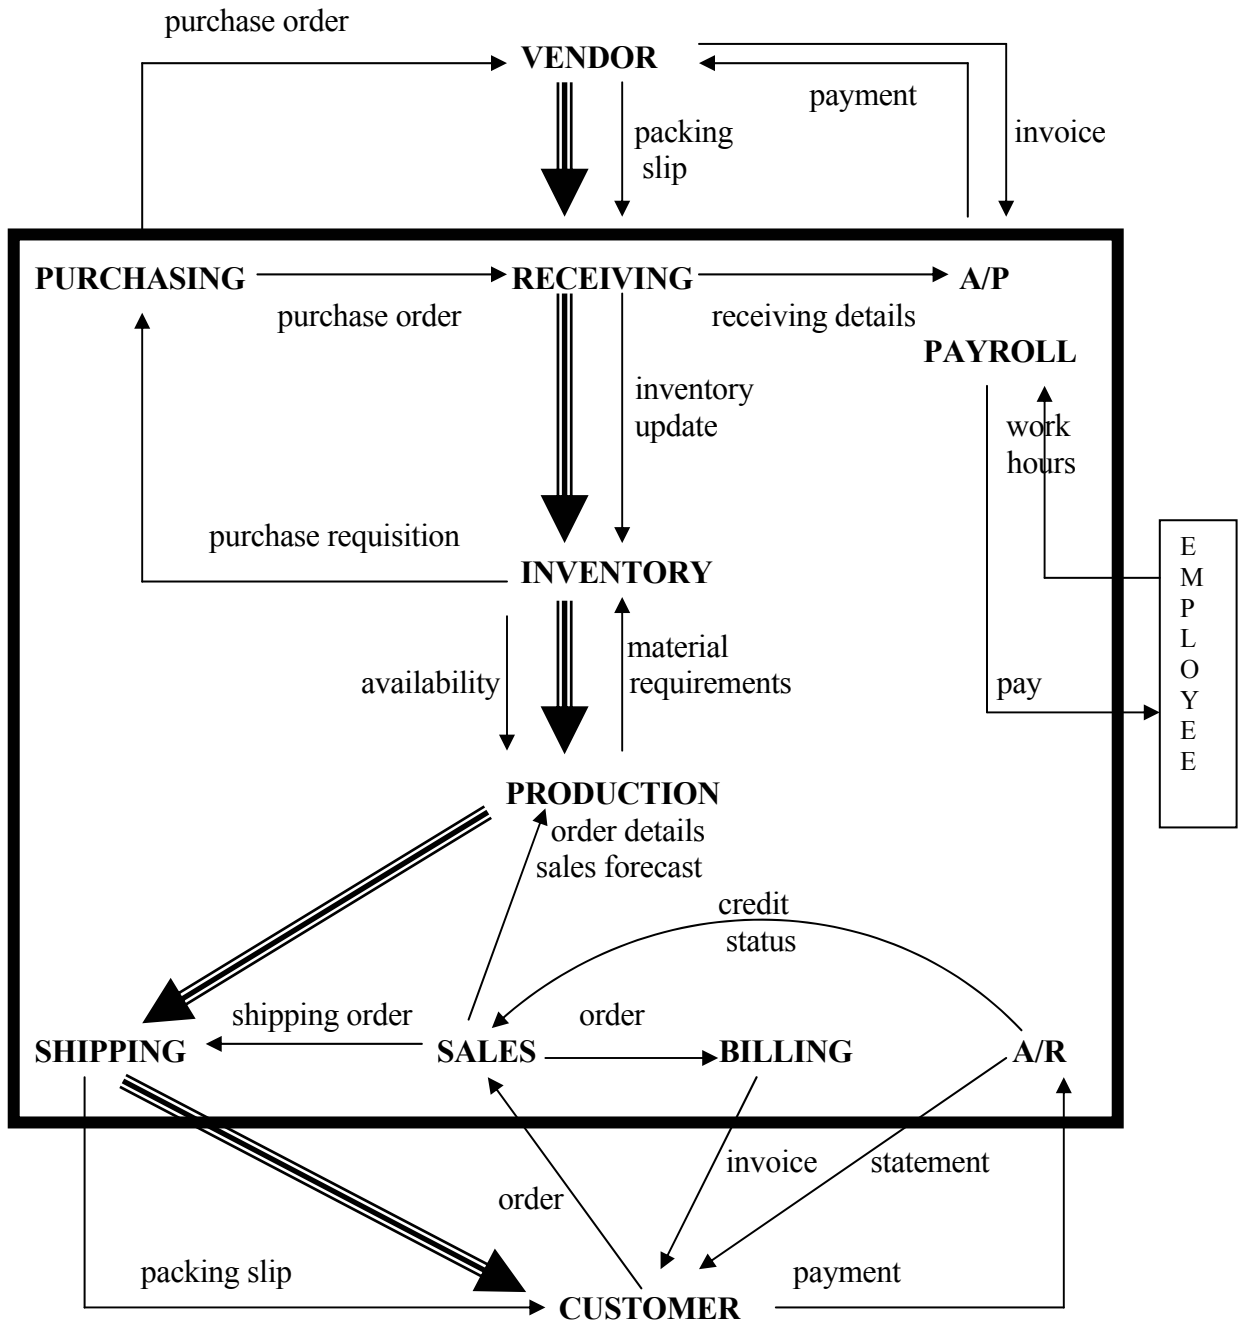

The Two Dimensions of a TPS

	Logical	Physical
External	The information exchanged between the external entity (especially customer) and the organization.	The technology (media) used for exchanging the information.
Internal	The flow of the information within the organization.	The technology (media) used for supporting the information flows within the organization

The external logical view of a typical sales TPS

Customer \rightleftarrows TPS	TPS \rightleftarrows Customer
<p>Preliminary request for information</p> <ul style="list-style-type: none"> - Functionality - Price - Availability - Transaction alternatives <p>Order details</p> <ul style="list-style-type: none"> - Product - Quantity - Transaction specifics <p>Customer details</p> <ul style="list-style-type: none"> - Name - Address - Financial details <p>Payment</p> <p>Request for delivery status</p>	<p>Preliminary information</p> <ul style="list-style-type: none"> - Functionality - Product name/number - Price - Availability - Transaction alternatives <p>Confirmation of receipt of order Confirmation of details</p> <p>Request for payment</p> <ul style="list-style-type: none"> - Amount - Payment alternatives <p>Receipt of payment</p> <p>Confirmation of shipment</p> <ul style="list-style-type: none"> - Order number - Date-to-be-shipped - Date-shipment <p>Delivery status</p>

A Generic View of a TPS

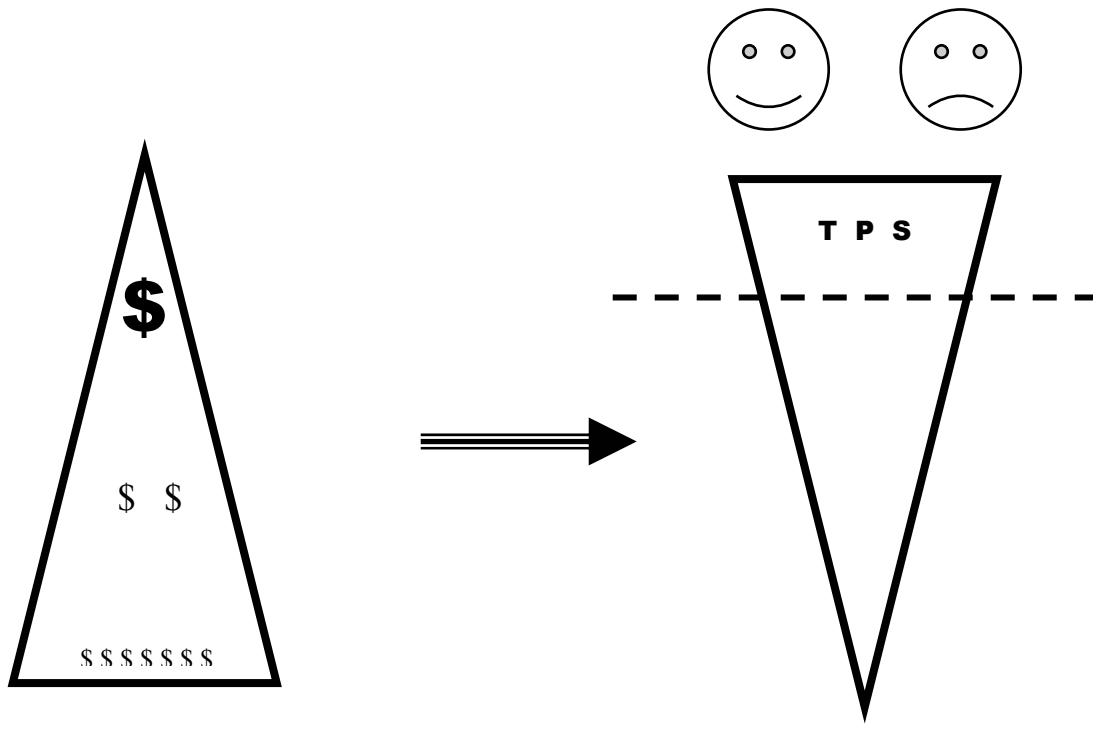

Note:

In a retail environment, there is no production subsystem connecting sales and inventory.

The Strategic Significance of TPS

Customer satisfaction has to do with

- Product/Service
- Process of purchasing product/service

Conventional View

Strategic-TPS View

“What on earth is strategic about order processing?!”

Typical TPS
- Huge amounts of data
- Generated/accessed 24/7/365
- In multiple locations

Customer Value

- Speed
- Accuracy
- Flexibility
- Reliability

Recorded business event

Data used for *running* the operations

Data used for *improving* the operations

The Ripple Effect:
Data traveling to other departments where needed

Documents produced as *proof of transaction*

TPS Template for:

Transaction	Transaction Data	Control Data	Related Data Updated	Output
